## 1. Introduction

COBGDB is a TUI (Text User Interface) application, programmed in C, designed to assist in animate and debugging GnuCOBOL code **using GDB**.

The project is hosted at <https://github.com/marcsosduma/cobgdb>

***Very important: you don't need to know GDB and all its many commands  
(<https://www.sourceware.org/gdb/>).***

***COBGDB has its own user interface that is very simple to use  
and is responsible for interfacing the underlying GDB which is the real debug and animate engine  
but operates practically in a transparent and invisible way for the user.***

The COBGDB application is based on the extension for Visual Studio Code (VSCode) created by Oleg Kunitsyn, which can be found on GitHub: <https://github.com/OlegKunitsyn/gnucobol-debug>.  
warning: COBGDB is still currently under development.

***At <https://github.com/marcsosduma/cobgdb> in the Windows subdirectory,  
the executable program cobgdb.exe for this operating system is available and ready to use.***

To compile COBGDB from C source code on Windows, you can use MinGW.

The Makefile is configured to generate the program **cobgdb.exe** for both Windows and Linux.

## 1.1. Installing the debugger on Windows

On Windows, just download **cobgdb.exe** from following folder:  
<https://github.com/marcsosduma/cobgdb/tree/main/windows>.

As an example you can put **cobgdb.exe** into the "bin" folder of your GnuCOBOL installation (the same folder where the GnuCOBOL compiler **cobc.exe** is located)

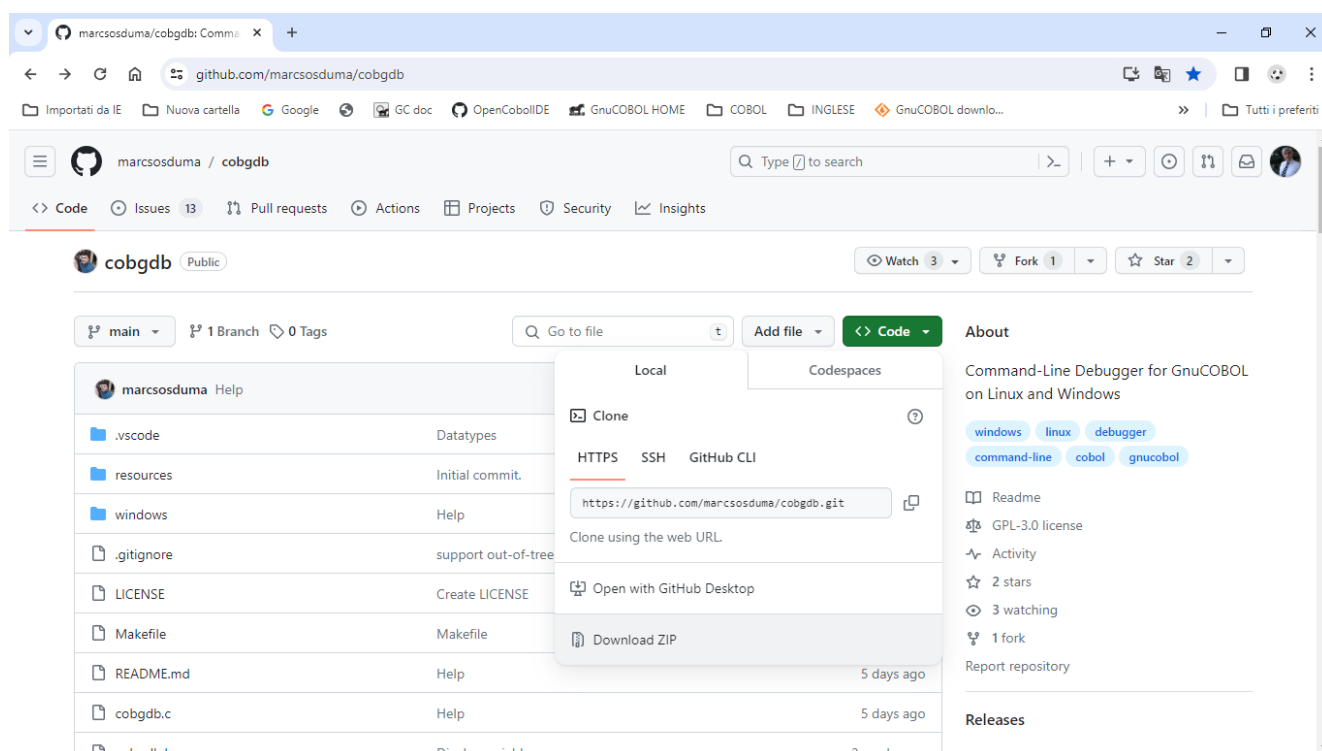

or

first install MinGW (Minimalist GNU for Windows).

Then execute the make ('mingw32-make' for Windows) command to compile the code from C source.

Note: if you have security problems downloading an .exe file then you can try download the entire repository with the following github button **<> Code v --> Download ZIP**

Then unzip the file and copy cobgdb.exe to the "bin" folder of your GnuCOBOL installation (the same folder where the GnuCOBOL compiler cobc.exe is located)

DOCUMENT CODE	MODULE: xxxxxxxxxx	USING COBGDB FOR GnuCOBOL	PAGE	GnuCOBOL

## 1.2. Compile and Debug GnuCOBOL programs

Compile and run a debugging session of the sample program using the following command:

```
cobgdb customer.cob -x -lpdcurses
```

Source code of customer.cob used also for following tutorial is at:

<https://github.com/marcsosduma/cobgdb/tree/main/windows>

Note: '-lpdcurses' is an instance of an argument that can be indirectly passed to 'cobc' by 'cobgdb,' even if it is not used by 'cobgdb' itself.

or, other example for cobc parameters , use : **cobgdb customer.cob -x -Tcustomer.txt** .(-T creates a compilation list output into **customer.txt** file )

COBGDB takes one or more programs with COB or CBL extension as parameters and runs the GnuCOBOL compiler with the following format:

```
cobc -g -fsource-location -ftraceall -v -free -O0 -x prog.cob prog2.cob ...
```

To debug multiple programs, use COBGDB with the following syntax:

```
cobgdb prog.cob subprog1.cob subprog2.cob . . .
```

This will create a single prog.exe executable.

You can run GDB/GDBSERVER remotely using the "A" (Attach) key.

COBGDB will prompt you to provide the server and port in the format server: port or the PID of the application.

### Example:

- localhost: 5555
- 9112

### 1.3. Main Commands

Cmd		Description	
<b>?</b>	Help	Show the HELP window and text	
<b>R</b>	Run	Runs the program <u>from the first Cobol statement</u> until a breakpoint is encountered. Always use this command to start a debugging session.	
<b>B</b>	Breakpoint	Toggle (Set or Unset) a breakpoint at a specific line of the Procedure Division code.	
<b>C</b>	Cursor	Runs the program until it reaches the selected line.	
<b>N</b>	Next	Runs the program until the next line but does not enter a subroutine executed by CALL or PERFORM.	
<b>S</b>	Step	Runs the program until the next line. If needed it enter a subroutine executed by CALL or PERFORM.	
<b>G</b>	Go	Continues the program execution until it encounters a stopping point: a breakpoint, end of the program, or the return from a subroutine (PERFORM / CALL).	
<b>J</b>	Jump	Ask for a line number and Runs the program until it reaches that line.	
<b>V</b>	Variables	Displays a window with a list of all variables for the running program. From this window you can also change the value of one or more variables.	
<b>H</b>	sHow	Displays a window with a list of variables from the selected line. From this window you can also edit / change the value of variables from the selected line.	
<b>F</b>	File	When cobgdb is executed with more than one program, allows selecting one of those source file to manage debugging commands.	
<b>A</b>	Attach	Attach to GDBSERVER or Application PID.	
<b>W</b>	Window size	Switch between two window size of the debugger : 24 x 80 or 34 x 132.	
<b>Q</b>	Quit	Quits (ends) the debugging session and the program (or programs).

## 2. Tutorial - Sample Debugging Session

Following tutorial is on a Windows 10 platform using following version of GnuCOBOL:

```

===== Version 3.2 =====

**GnuCOBOL 3.2 (28Jul2023) MSYS2 64-bit [GC32M-BDB-x64.7z](#)** -- MSYS2 64-bit GnuCOBOL 3.2

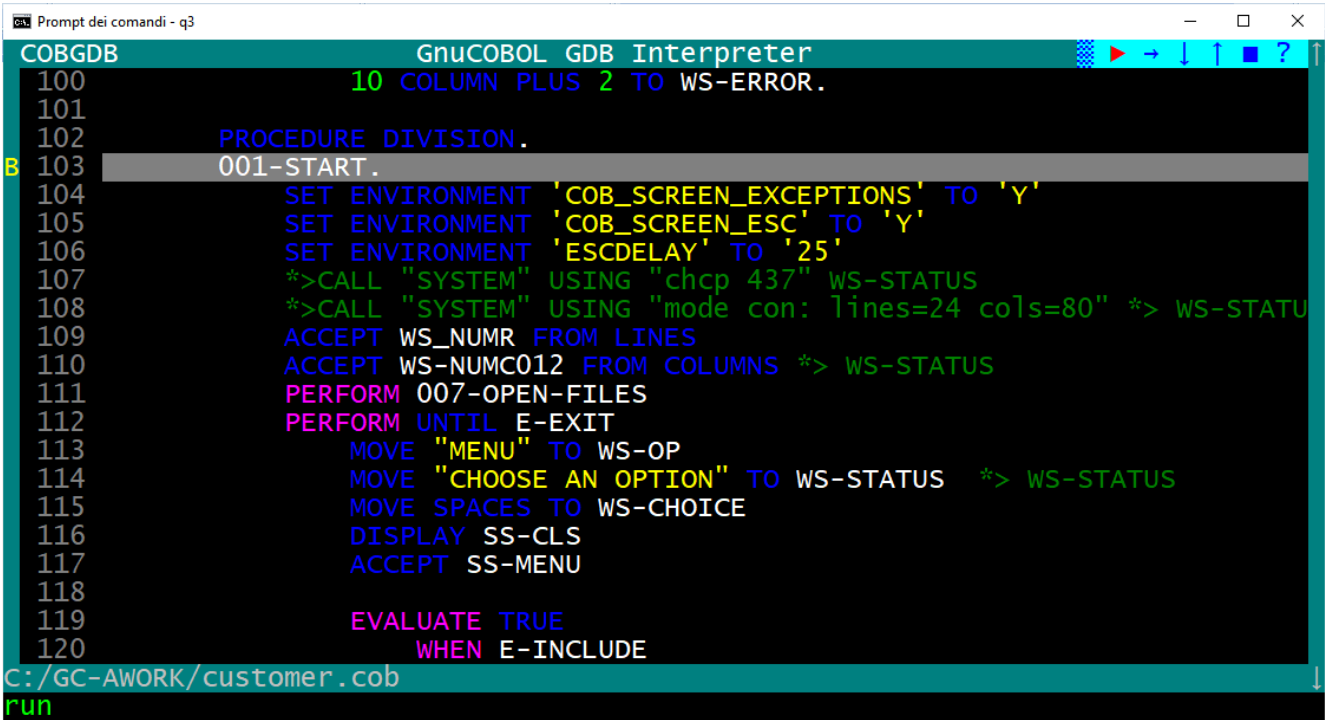

Final release **with full debugging support**. (95.4 Megabytes).

**GnuCOBOL 3.2 (28Jul2023) MSYS2 32-bit [GC32M-BDB-x32.7z](#)** -- MSYS2 32-bit GnuCOBOL 3.2

After executing **cobgdb customer.cob -x -lpcurses** the application automatically insert a Breakpoint at first executable program statement of PROCEDURE DIVISION (see the **B** symbol at left of line 103 in this sample) and displays following screen:

You can scroll the source code window with cursor keys UP and DOWN, PG UP and PG DOWN or with mouse wheel or with mouse left click on the right scroll bar. Use cursor RIGHT and cursor LEFT to scroll horizontally,

In the upper right window corner there is a "button bar" where you can find some buttons (symbols):

> → ↓ ↑ ■ ?

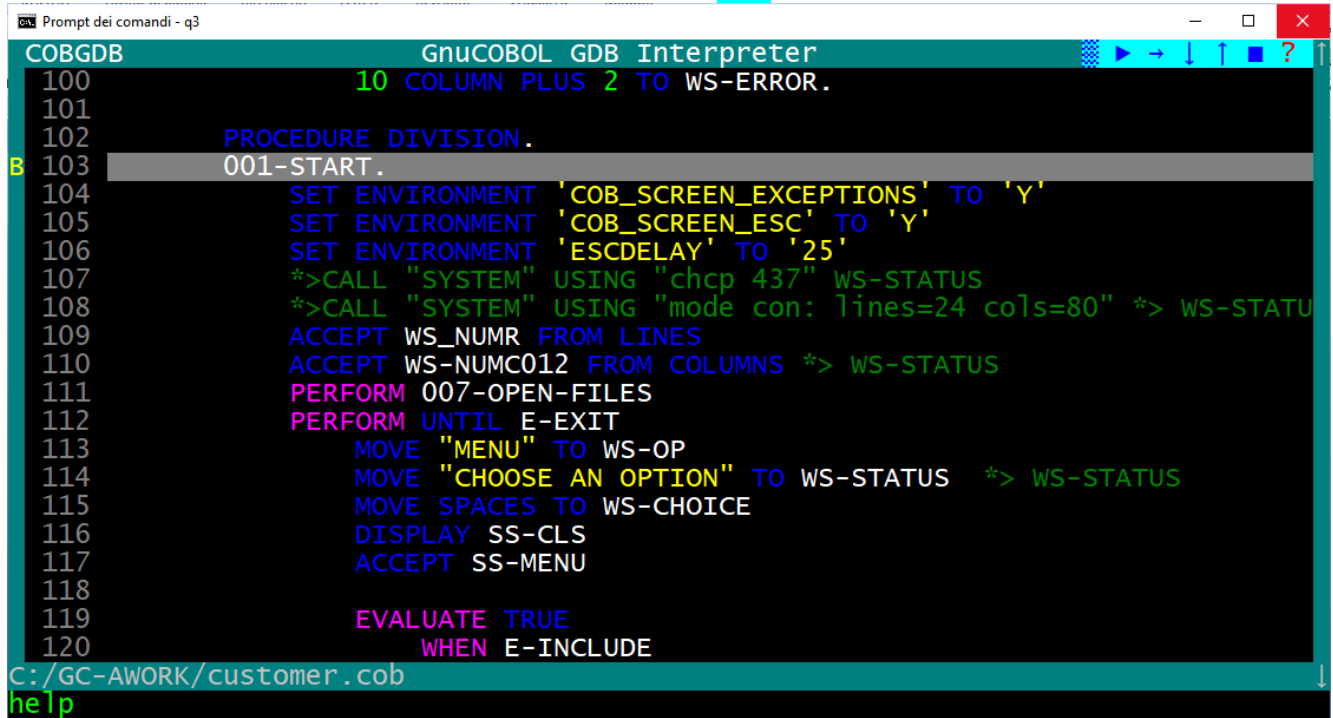

>	=	<b>Run</b>	command
→	=	<b>Next</b>	command
↓	=	<b>Step</b>	command
↑	=	<b>Go</b>	command
■	=	<b>Quit</b>	command
?	=	<b>Help</b>	command

when you hover over one of these symbol, you get the corresponding command description (like a tooltip) displayed at the bottom left of the screen.

## 2.1. Help Command

Type ? (key) HELP command or left click with mouse on the  button:

the HELP window is displayed

scroll the Help window with cursor keys UP and DOWN or mouse wheel.

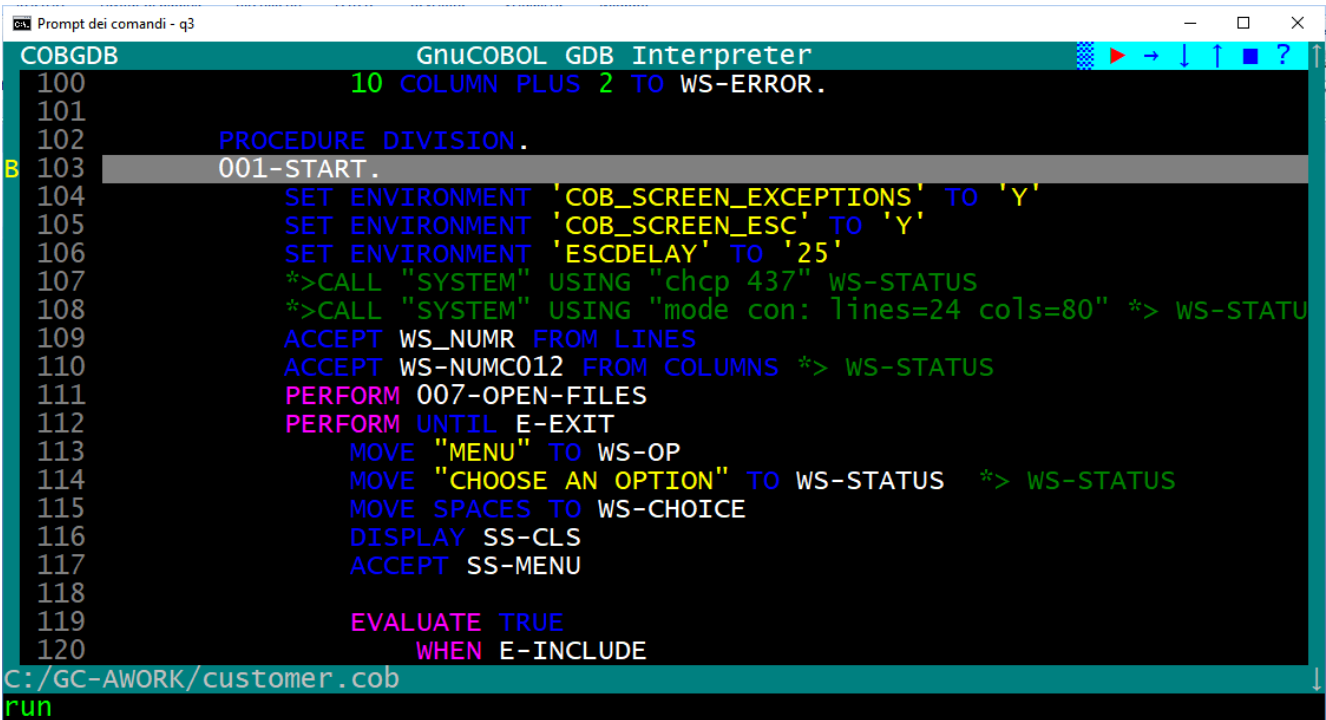

Use ESC or Enter or left click to exit from this HELP window and return to debugging session.

## 2.2. Run Command

To start executing the program and the debugging session from first program statement you always must use the "R" command (key) or left click with mouse on the  **Run** button

```

Debugging

```

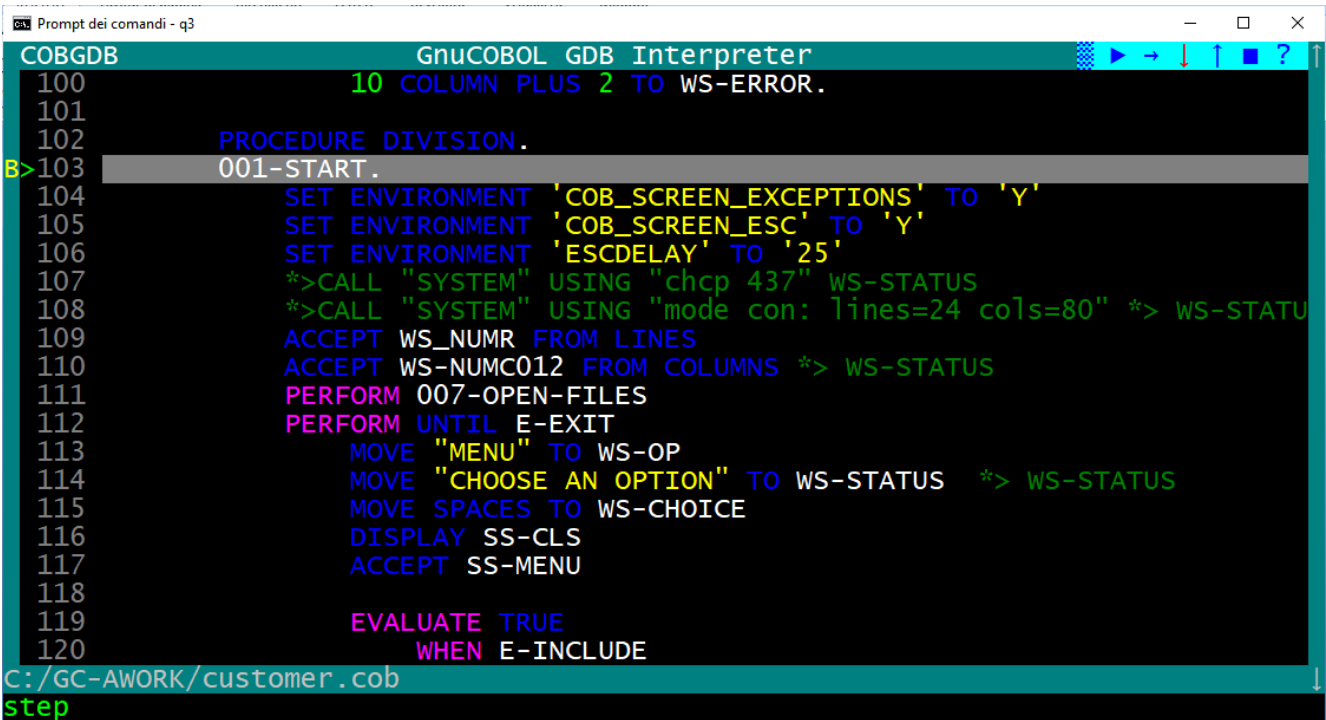

From that moment on, you can use all the commands (keys) or corresponding buttons to "animate" and debug the application, example: **"S"** (Step), **"N"** (Next), **"G"** (Go) and so on.

During the source code animation, the debugger automatically shows some pop-up windows with variables content from the line in execution.

Blue frame and values : variables of executing cobol statement

Black frame and values : variables of last executed cobol statement.

## 2.9. File Command

To show this command we use following sample:

```
cobgdb sample.cbl subsample.cbl subsubsample.cbl -x -lpdcurses
```

where sample.cbl is the main program; it calls

--> subsample.cbl; it calls

--> subsubsample.cbl

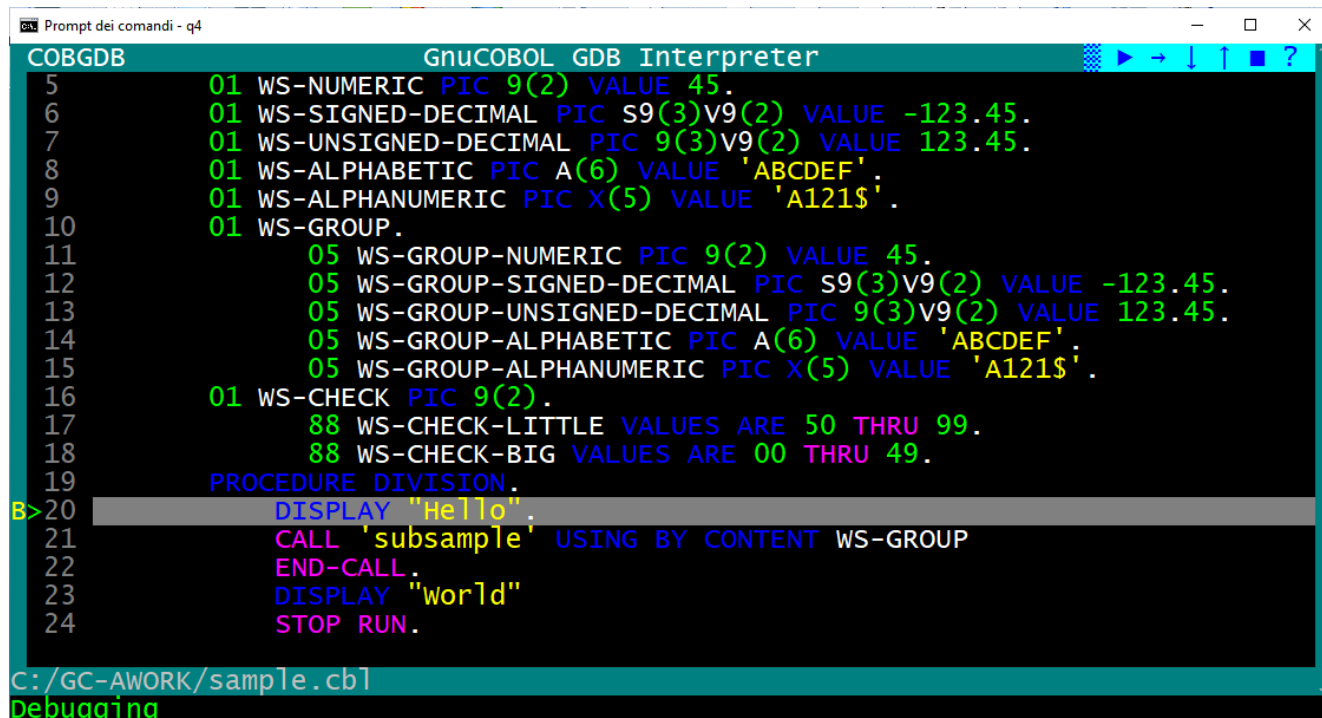

Source code is at <https://github.com/marcsosduma/cobgdb/tree/main/resources>.

This will create a single sample.exe executable.

This example shows that when you need to debug only subsample.cbl or only subsubsample.cbl you need to execute COBGDB with all three programs.

COBGDB sets the B breakpoint at first executable statement of first program "sample.cbl".

here use the R Run command to start the debugging session.

```

```

This can be very useful when you write GnuCOBOL code with the GnuCOBOL FREE FORMAT source option where each line of code can be longer than the classic 80 characters of GnuCOBOL FIXED FORMAT.

Warning.  
 Make sure the system font size is not too large otherwise the W command cannot display the 132 columns.  
 For a Windows environment use "Property" menu item to chek or change the Font size:

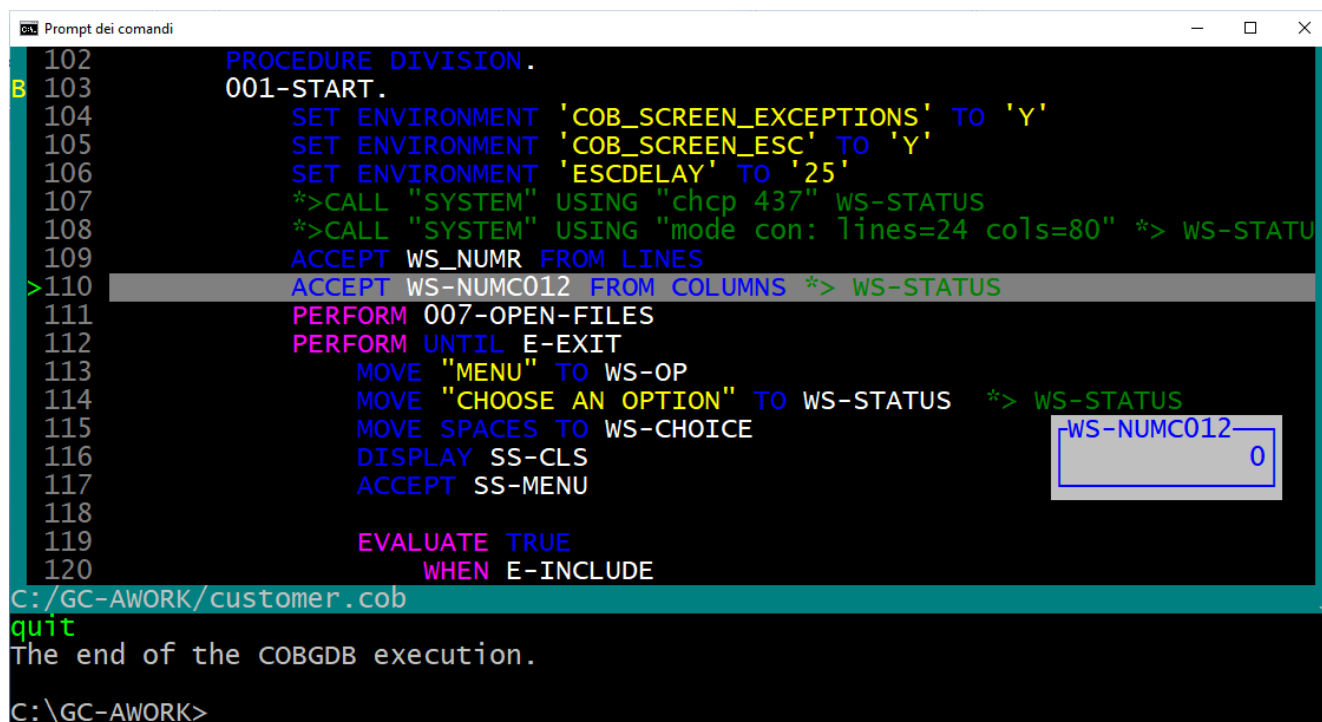

and then select a suitable font, for example Lucida Console of 16 might be adequate.

## 3. Other Line Commands

### 3.1. Debugging a pre-compiled Program

You can use COBGDB to debug a previously generated executable file.

To do this, you must first compile the program with these options:

```
cobc -g -fsource-location -ftraceall -v -O0 -x prog.cob prog2.cob ...
```

To start debugging without recompile the program, run cobgdb using the **--exe** directive as follows:

**Windows:**

```
cobgdb --exe prog.exe
```

**Linux:**

```
cobgdb --exe prog
```

### 3.2. COBGDB Version

Use command option: `cobgdb --version`

to display COBGDB version informations as follows:

```
COBGDB - GnuCobol GDB Interpreter - version 1.1.0
